March 3, 2026

1 Topic

The topic of the planned research is to validate output from an automated concert newsletter. [1] An example can be found in the appendix. This newsletter uses an LLM to scrape different concert venues in different cities, and compiles a list of the different acts. This LLM also generates a list of artists, genres and a summary, which can often contain mistakes. The goal of the research is to find out how to validate the output of the LLM by using real web-data and possibility how we can adapt this onto other AI Agents.

2 Methods

To store and query the webdata, we will be using an Open Web Index [1] which stores the data in a standard, open source file format (Parquet). This reduces costs and resources, instead of using any other paid search API.

3 Timeline

Since I wish to graduate this semester, I will be starting the research from this week and hoping to finish this at the end of Q4, inline with the summer break. Weekly meetings with my supervisor have already been set up.
